

Project 3: My Website is My Body is My Website

Taking a more experimental approach where we treat the website as a public installation, how do we interact with websites, and through what device?

Prompt

What if we could design websites not as tools, portfolios, or static documents—but as spaces? What if a website could behave like a sculpture: layered, spatial, inviting touch, resisting closure, responding to presence?

Inspired by Mouchette.org—a website that haunted early internet users with its playful, morbid, and controversial persona—you are invited to build your own interactive website that explores the web as a **site of collective authorship**, speculation, and co-presence.

Core Questions

- What does it mean to invite others into your website as collaborators, not just visitors?
- How can your website reflect both the digital *and* physical context it is situated in?
- If *Mouchette.org* captured the complexity and shadows of early internet culture, what kind of **new collective experience** could we design now—one that carries care, curiosity, humor, or repair?
- How can your website reflect the presence of others—users, environments, or imagined communities?

Project Goals

- Treat your website as a **living environment** rather than a finished object.
- Design with your **users** in mind as **co-authors**, not consumers.
- Experiment with **forms of interaction** that shift power or authorship.
- Consider how your project might live beyond the screen: could it respond to space, time, weather, or people in the room?
- Embrace ambiguity, play, vulnerability, and feedback.

Requirements

- Create a website that includes **at least 3 interactive elements**.
 - This could be user-submitted content, branching narratives, changing states, or sensor-driven input.
- Your site should explore at least **one mode of collective engagement**.
 - Think critically about where and how the website is placed
 - For example: co-writing, voting, personal confessions, memory-sharing, or live input from physical spaces.
- Include an **"About this Space" page** where you articulate your intent, speculative purpose, and how users should interact with the site.
- Final project must be **deployed** on GitHub
